

Question Part 1.

I am writing this document inside RStudio, using Sweave. I want everything in the document to be doublespaced with the exception of R code chunks, which I want to be singlespaced for the sake of tidiness and saving space. It is important that the code chunks also run in R, since they may be doing things like telling R to draw plots which will be part of the document.

Question Part 2.

The problem that I seem to be having is that when I put in a command to begin singlespacing and a command to end single spacing around an R code chunk, text that is not inside the begin and end singlespacing command, for some reason, ends up being singlespaced as well, even though as far as I can tell it should be doublespaced, as can be seen with the text in this very paragraph (if you've compiled it into a .pdf).

```
k=3
mse=0.347
d=0.85
alpha=0.05
n=30
pwr.df=data.frame(row.names = 1:n)
pwr.df$n=1:n
```

Strangely, the problem doesn't occur for text which follows the "end" of the singlespacing command, but text which comes before the 'begin' singlespacing command is affected, as can be seen here.
